Wetland Restoration

Existing Wetlands and Mudflats
Most of the tidal lagoon contains mudflats that provide an area for migrating birds, aquatic life, and invertebrates. However, the woodland edge runs right up to the edge of the lagoon. The current site lacks a robust littoral zone.

Littoral Zone
Light reaches all the way to the bottom of the water in the littoral zone. This shallow water area is a prime place for wildlife to interact and feed.

Wildlife
- Striped Bass
- Coastal Plain Leopard Frog
- Egret
